Measure it right

IoT · Level 1 · Lesson 3

Today you will

- Read a scale carefully: the unit, eye level and what each small step is worth.
- Record a measurement with its number, unit, time and place.
- Spot a reading that can't be right, and say what to do about it.

Measure it right

- Every number needs its unit
- Find what each gap is worth
- Read at eye level
- Number, unit, time, place

Measure it three times

1. Choose what to measure, and the tool
2. Find what each small gap is worth
3. Measure three times, at eye level, the same way
4. Write the number, unit, time and place
5. Compare with a friend; explain any difference

If you make a bottle rain gauge, an adult cuts the bottle and tapes the sharp edge. If a glass thermometer breaks, don't touch it: tell an adult.

Let’s discuss

1. Why might two careful people get slightly different readings?
2. When is it fair to leave a reading out, and what must you write down?
3. Where in daily life do you see numbers with no unit?

Check yourself

- There are 5 gaps between 0 and 10 on a scale. What is each gap worth?
