IF this, THEN that

IoT · Level 3 · Lesson 1

Today you will

- Write a rule as IF a condition THEN an action.
- Combine conditions with AND and OR to make better rules.
- Test rules through a day and fix the ones that go wrong.

Rules that decide

- IF a condition, THEN an action
- A condition needs a number and a unit
- AND needs both; OR needs either
- Test every rule through a day

Rules for a day

1. Choose a device: a fan, a light, a pump or a tap.
2. Write three IF/THEN rules with numbers and units.
3. Use AND or OR in at least one rule.
4. Draw the day from 6:00 to 22:00 and test each rule.
5. Mark what goes wrong, then fix the rule.

Paper is enough for this activity. Watch real devices only from a safe distance: never open a fan, a pump or a socket, and never touch mains wiring.

Let’s discuss

1. Which rule around you is too simple, and what would you add to it?
2. When is OR safer than AND, and when is AND safer than OR?
3. What should a device do when its sensor breaks?

Check yourself

- Write one rule that uses AND, and say when it switches on.
