Check before you trust a model

AI security · Upper secondary · Lesson 4

In this lesson you will

- Explain how the AI supply chain can be attacked.
- Compute and compare a SHA-256 fingerprint in Python.
- Explain what a signature adds, and keep a model list.

Remember

- Any link in the chain can be faked or changed.
- A fingerprint proves the same bytes; a signature proves who made them.
- Official source, check both, keep a list.

Activity: Check the chain

1. Warm-up (3 min): Where did the apps on your phone come from?
2. Fingerprint (7 min): Compute a fingerprint, change one letter, compare.
3. List (5 min): Start a model list: name, version, source.
4. Share (5 min): Which entry would you remove, and why?

Only look at a family phone with its owner, and don't install anything new during the activity.

Let’s discuss

1. Why can't a fingerprint alone prove who made a file?
2. Why are free “pro” versions shared in groups so risky?
3. What would you put on your family's model list?

Check yourself

- Write the two checks you'd do before running a downloaded model, and what each one proves.
