How attacks work, and how to defend: review

Cyber security · Level 3 · Unit check

In this unit

- Malware: how it gets in
- Social engineering: hacking people
- Attacks on passwords, and the defences
- Secret messages: encryption basics

The big ideas

- Most malware is invited in: official store, updates, backups
- Tricks play on feelings: pause, check another way, say no
- Length and uniqueness beat guessing and leaks
- Encryption is strong; keep your keys secret

Defender's map

1. Draw (5 min): Your phone in the middle, four attacks around it.
2. Defend (8 min): Write the defence for each attack.
3. Check (4 min): Tick the defences you already have.
4. Plan (3 min): Circle one to set up this week.

Keep the map: it's a checklist you can show someone at home.

Think about it

1. Which attack in this unit is most likely to reach you, and why?
2. Which defence protects against more than one attack?
3. Who at home would you most like to teach, and what?

Before you go

- The one defence I’ll set up this week, and when.
