How it picks a tool

AI agents · Level 3 · Lesson 2

Today we will

- Explain how a model picks a tool from the tools line and the request.
- Compare trained and new wordings, and say why new ones slip more.
- Write checks that stop a wrong call before it runs.

Remember

- The model reads only the tools line and your words.
- It copies details into arguments: 96–98% right with trained wordings, 78–80% with new ones.
- The app checks every call: tool on, words from the request, the right shape.

Same request, new words

1. Warm-up (5 min): Ask a classmate the time in three ways.
2. Teach (8 min): The tools line, arguments and slips.
3. Same request (15 min): A pupil agent with a pattern card.
4. Catch the slip (7 min): Spot a wrongly copied class name.
5. Wrap-up (5 min): Write our three checks, then the exit ticket.

Prepare a pattern card with three or four fixed wordings, the list of the school’s classes on the board, and paper slips for the calls. No phones are needed.

Let’s discuss

1. Why might an agent understand one wording and not another?
2. Which slips would matter most at our school?
3. Why is a simple rule a good checker?

Exit ticket

- Write one request in two wordings, and one check the app should make before the tool runs.
