Confident, wrong and risky

AI security · Level 1 · Lesson 2

Today we will

- Explain why a confident AI answer can be wrong.
- Place AI answers on a stakes ladder.
- Choose the right check, and who to ask.

Remember

- Sounding sure is not the same as being checked.
- The higher the stakes, the stronger the check.
- Watch for automation bias: ask “How do you know?”

The stakes ladder

1. Warm-up (5 min): Has a confident answer ever fooled you?
2. Teach (8 min): Why AI can be wrong; the stakes ladder.
3. Ladder (15 min): Groups place five AI answers on the rungs.
4. Check it (7 min): Check one answer in the textbook together.
5. Wrap-up (5 min): Who are our experts? Then the exit ticket.

Write the five answers on paper strips beforehand. Make the burn and cleaning answers clearly dangerous (for example “mix bleach and vinegar”), so pupils learn never to try them, and say so.

Let’s discuss

1. Why can an AI answer sound sure and still be wrong?
2. Which answer was the hardest to place on the ladder?
3. Who can you ask when an answer is about health or safety?

Exit ticket

- Write one AI answer that would be high stakes, and who you would ask to check it.
