Poisoned data

AI security · Upper secondary · Lesson 3

In this lesson you will

- Explain data poisoning and backdoors.
- Find suspicious labels with a neighbour check in code.
- Decide what to remove, and record why.

Remember

- Whoever touches the data can steer the model.
- Backdoors pass normal tests and wait for their trigger.
- Code flags; a person decides and writes down what was removed.

Activity: Find the poison

1. Warm-up (3 min): Guess: can two wrong labels change a model?
2. Measure (7 min): Measure and label ten things; a friend flips two.
3. Check (5 min): Sort them and flag labels both neighbours disagree with.
4. Share (5 min): What did the check find, and what did it get wrong?

Measure harmless things, like leaves or beans. No device needed: the neighbour check works on paper.

Let’s discuss

1. Why can't a high test score prove the data is clean?
2. Why should a person look before anything is removed?
3. Where could someone plant a wrong label in your school's data?

Check yourself

- Explain the neighbour check in one sentence, and one thing it can get wrong.
