How AI is attacked and defended: review

AI security · Upper secondary · Unit check

In this unit

- Filters that miss
- Only the tools it needs
- Poisoned data
- Check before you trust a model

The big ideas

- Check the action in code, not the words
- Fewest tools: an allow-list and a person's yes
- Poisoned data: code flags, a person decides
- Fingerprint the bytes, check the signature

Activity: Defend the class bot

1. Warm-up (3 min): Recall one defence from each lesson.
2. Plan (7 min): Design the defences for a made-up class bot.
3. Attack (5 min): A partner tries four attacks on paper.
4. Share (5 min): Which defence stopped each one?

Use made-up bots, messages and files only.

Let’s discuss

1. Which defence from this unit surprised you most?
2. Where is a check in code better than a rule the model reads?
3. How would you explain least privilege to a younger student?

Check yourself

- My most useful defence from this unit, and where I'd use it.
