Decisions: if, elif and else

Programming · Level 2 · Lesson 2

Today we will

- Compare values with ==, <, >= and the others.
- Write if, elif and else with colons and indents.
- Test a marking rule at its boundaries.

Remember

- = stores a value; == compares two.
- Only the first true branch runs: order matters.
- Test where the answer changes: 49, 50, 51.

Find your corner

1. Warm-up (5 min): Stand up if… conditions.
2. Teach (10 min): The grading rule as if, elif and else.
3. Sort (10 min): Pupils with mark cards go to their grade’s corner.
4. Run (10 min): Run the disputed marks on the phone.
5. Wrap-up (5 min): Why do boundaries cause bugs? Exit ticket.

One phone is enough: you run the program, and the pupils are the data. Download the lesson the day before so Python works offline.

Let's discuss

1. Why is 50 the mark most likely to be graded wrong?
2. What goes wrong if the B test comes before the A test?
3. Which other school rule could be an if statement?

Exit ticket

- Write the marks you would test for “40 or more passes”, and why.
