Misconceptions and feedback

Programming · Level 3 · Lesson 4

Today we will

- Recognise the common programming misconceptions.
- Use hinge questions with diagnostic wrong answers.
- Give feedback that asks instead of fixing.

Remember

- = vs ==, range’s end, input is text, or needs two conditions.
- Each wrong answer of a hinge question maps to a misconception.
- Ask “which line runs when…?” instead of giving the fix.

Fingers up

1. Warm-up (5 min): Show a misconception in a pupil's code.
2. Teach (10 min): The common misconceptions.
3. Hinge (5 min): Everyone answers a hinge question at once.
4. Reteach (15 min): Group by answer; feedback that asks.
5. Wrap-up (5 min): Ask the hinge question again. Exit ticket.

Fingers or cards need no devices and show you every pupil's thinking at once. Count quickly; don't name pupils who chose wrong answers.

Let’s discuss

1. Which misconception is most common in our classes?
2. Why do all pupils answer a hinge question at once?
3. How does feedback that asks change what pupils do next time?

Exit ticket

- Write a hinge question about range, with the misconception behind each wrong option.
