# Hello, Python

## Programming · Level 2 · Lesson 1

# In this lesson you will

- Print text and numbers.
- Calculate with + - * / and **.
- Run a program top to bottom, exactly as written.

# Key ideas

- Text in quotes is shown as written.
- * and / come before + and -.
- An error message is a clue, not a disaster.

# Activity: Predict, then run

1. Warm-up (3 min): What will print(2 + 3 * 4) show?
2. Predict (7 min): Write what five short programs will print.
3. Run (7 min): Run them and mark your predictions.
4. Explain (3 min): Why was one prediction wrong?

**You can do the predictions on paper with no phone, then check them together on one phone.**

# Let’s discuss

1. Why does Python show text exactly as written?
2. When do you need brackets in a sum?
3. What is an error message good for?

# Exit ticket

- Write a line that prints 10, and a line that prints 7 + 3 as text.
