First Python: review

Programming · Level 2 · Unit check

In this unit

- Hello, Python
- Variables and input
- Decisions
- Loops

The big ideas

- Python runs one line at a time; text in quotes is shown as written
- Variables remember; input() gives text, int() makes numbers
- == compares; only the first true branch runs
- range(a, b) stops before b; while needs something to change

Activity: Quiz show

1. Warm-up (3 min): Write one thing you learned in each lesson.
2. Make (7 min): In pairs, write a three-question quiz program on paper.
3. Swap (7 min): Another pair predicts what it prints.
4. Run (3 min): Run one quiz on the phone.

Let’s discuss

1. Which lesson was the hardest, and why?
2. Which error message do you understand best now?
3. What program will you write next?

Exit ticket

- One program I could write now that I couldn’t before
