Tidy sheets a computer can use

Data engineering · Level 2 · Lesson 1

Today we will

- Lay out a sheet a computer can use.
- Keep the raw data apart from the summary.
- See how a program reads a tidy CSV file.

Remember

- One header row, one row per pupil, one value per cell.
- Never type over the raw sheet.
- Text must become a number before you add it.

From messy to tidy

1. Warm-up (5 min): What's wrong with this sheet?
2. Teach (8 min): The tidy rules, and raw versus summary.
3. Redraw (15 min): Groups make the sheet tidy.
4. Compare (7 min): Whose average is right?
5. Wrap-up (5 min): The same sheet in Python.

Use made-up names on the messy sheet. Make sure the merged cells and the Total row really change the average, so the groups' answers differ.

Let’s discuss

1. Why should nobody type over the raw sheet?
2. What did a Total row do to our average?
3. Why does Python need int() before adding marks?

Exit ticket

- Write the three rules of a tidy sheet, and one thing that belongs on the summary sheet.
