Names that agree

Data engineering · Level 2 · Lesson 2

Today we will

- Find the ways one name gets typed.
- Tidy, then match to one master list.
- Stop new spellings with a drop-down list.

Remember

- Computers match names letter by letter.
- Tidy first, then match the master list.
- Prevention beats cleaning.

One spelling, one list

1. Warm-up (5 min): How many pupils are on this list?
2. Teach (8 min): Letter by letter.
3. Match (15 min): Groups build the master list.
4. Recount (7 min): The register, again.
5. Wrap-up (5 min): How do we stop it next time?

Use made-up names, never your pupils' real ones. Include at least one Arabic letter variant and one name that isn't on the list at all, to show that it's set aside, not guessed.

Let’s discuss

1. Why does the computer see “Amina ” and “Amina” as two pupils?
2. What should we do with a name that isn’t on the master list?
3. Why look for repeats only after the names agree?

Exit ticket

- Write one name three ways a computer would count as three pupils, and the one spelling you’d keep.
