Reading numbers: units and scales

IoT · Level 1 · Lesson 2

Today we will

- Read a thermometer scale at eye level, working out what each small step is worth.
- Record a reading with its number, unit, time and place.
- Explain why two readings must be taken the same way before we compare them.

Read it right

- Find each step’s value
- Read at eye level
- Write the number and unit
- Add the time and place

Read the thermometer right: Reading round

1. Warm-up (5 min): Write “30” on the board.
2. Teach (8 min): Write the four parts of a reading on the board: number, unit, time, place.
3. Eye level (7 min): Hold up a clear bottle of water with a paper scale taped on. Pupils read it from above, from below and level.
4. Reading round (14 min): Pairs read the board scale as you move a chalk line, writing full readings.
5. Wrap-up (6 min): Set up a class log by the door with columns for date, time, place and °C.

Hang the thermometer in the shade at pupils’ eye height an hour before class. Draw a big thermometer scale on the board from 0 to 50, with five steps between each labelled ten. Make a paper thermometer if the school has none. Tape a paper scale on a clear bottle of water for the eye-level demonstration.

Let’s discuss

1. What else do we need to know?
2. Is it fair to compare the sun reading with the shade reading?
3. What changed besides the weather?

Exit ticket

- Write one full reading: number, unit, time and place.
