Lesson plan · for the teacher

Pupils' data, cost and the right agent

AI agents · Level 2 · Lesson 4

Time
40 min

Materials
Ten job cards (tomorrow's weather, a trip letter, report comments, a pupil's marks, a medical note, a list of library books…); Three sheets labelled "On the phone", "In the cloud, no names" and "Never"; Data prices from a local network (optional)

Learning goals

- Ask where an agent's data goes before you send it.
- Share the task, not the child.
- Compare the cost of a cloud model and a model on the phone.

Activity: Where does the data go?

1. Warm-up (5 min): Ask who has pasted something into a chatbot, and what. Ask: where do you think it went?
2. Teach (8 min): Explain personal data with examples (a name, a mark, a photo, an illness), name your country's data protection law, and give the rule "share the task, not the child".
3. Sort the cards (15 min): Groups sort ten job cards onto three sheets: "On the phone", "In the cloud, no names" and "Never". Each group defends one choice to the class.
4. Do the sums (7 min): Work out together 20 requests a day × 30 days × 18 KB, and compare it with Darsi Tiny's 2.8 MB download and a typical phone bundle.
5. Wrap-up (5 min): Ask: when is a big cloud model worth its cost, and when is a small one enough? Then give the exit ticket.

Prepare ten job cards and three labelled sheets. Use made-up names only, and never real pupils' records.

Discussion

- What would you never paste into a cloud agent?
- When is a big cloud model worth its cost?
- How could a school with no signal still use an agent?

Exit ticket

- Name one job for a cloud agent and one for a model on the phone, and say why.

Try it in class tomorrow
Play "Where does the data go?": groups sort school jobs into three piles (fine on the phone, fine in the cloud without names, never) and explain one choice to the class.

Worksheet · for pupils

Pupils' data, cost and the right agent

AI agents · Level 2 · Lesson 4

Name _____ Class _____ Date _____

1 **Pupils in a village with no signal need help with the timetable and simple sums. Which agent fits?**

◯ A big cloud model ◯ A small model on the phone

◯ Neither: agents always need the internet

2 **Which of these are personal data? Choose all that apply.**

☐ A pupil's name ☐ A pupil's maths mark ☐ Tomorrow's weather in Kafi

☐ A photo of the class ☐ 6B's timetable ☐ A pupil's illness

3 **Match each job to the best choice.**

The timetable and sums, in a village with no signal	• • • •	No agent: a person, with permission
Drafting a general letter about a new school rule	• • • •	Sample comments from an agent; names added offline
Report comments for named pupils	• • • •	A big cloud model, with no pupils' data
Reading pupils' medical notes	• • • •	A small model on the phone

4 **A big cloud model costs data on every request, while a model on the phone costs data only for its first download.**

◯ True ◯ False

5 **Each cloud request uses about 18 KB, and Darsi Tiny's download is about 2.8 MB. After roughly how many requests has the cloud used more data than the download?**

◯ About 15 ◯ About 150 ◯ About 1,500

✎ **Think of one job you'd like an agent's help with. What data would it touch, where would that data go, and what would it cost on your bundle?**

_____

_____

_____
