Audit an AI tool

AI · Level 4 · Lesson 1

Today we will

- Test a voice or translation tool with our own voices and languages.
- Count its mistakes for each speaker and language.
- Explain why a tool can work better for some people than for others.

Remember

- A tool can be very accurate on average and still fail some people.
- Voice tools often make more mistakes with accents and languages they heard less in training.
- To judge a tool, test it on people like us and count its mistakes for each group.

Test the tester

1. Warm-up (5 min): Ask who has used voice typing or a translation app, and whether it understood them.
2. Plan (7 min): Agree one sentence and the groups to compare.
3. Test (15 min): Pupils take turns reading the sentence into one phone; the class tallies wrong words.
4. Compare (8 min): Groups compare the tallies and say who the tool works best for.
5. Wrap-up (5 min): Link it to audits: one score can hide a group.

Try the phone first. Offline voice typing or an offline translation app in your languages saves data and keeps pupils' voices on the phone. Speakers are volunteers: nobody has to speak. Record numbers only; keep no recordings.

Let’s discuss

1. Who did the tool understand best? Why might that be?
2. Whose voices do you think it learned from?
3. Should our school use a tool that works better for some pupils than for others? What would you ask first?

Exit ticket

- One group the tool found hard, and one question you would ask the company that made it.
