When AI gets it wrong

AI · Level 1 · Lesson 4

Today we will

- Tell a false alarm from a miss.
- Explain that people choose which mistake matters more, and that gaps in the data cause mistakes.
- Check, ask a person and report when AI gets it wrong.

Remember

- False alarm: something harmless is flagged. Miss: something real slips through.
- Moving the threshold trades one mistake for the other, and people decide which matters more.
- When AI is wrong: check, ask a person, report it.

Be the filter

1. Warm-up (3 min): Share one time an app got something wrong.
2. Write (5 min): Write 10 short messages, some real and some scams.
3. Filter (8 min): One person calls each message “spam” or “safe”; the others count false alarms and misses.
4. Move the line (6 min): Play again, first very strict, then very relaxed, and compare the counts.
5. Decide (4 min): Agree which mistake matters more for school messages, and why.

You need 10 slips of paper and a pen. Write the answer (real or scam) on the back of each slip before you start, and use made-up names and numbers only.

Let’s discuss

1. For a school message filter, which mistake is worse: a false alarm or a miss?
2. Whose voices or languages might an AI tool near you know least?
3. Have you ever reported a mistake to an app? What happened?

Exit ticket

- Give one example of a false alarm and one of a miss.
