How a chatbot writes

AI · Level 2 · Lesson 1

Today we will

- Explain how a chatbot writes, one likely piece at a time.
- Say why it can sound sure and still be wrong.
- Explain why it may know less about your country and language.

Remember

- A language model learned patterns from huge amounts of text, and writes by predicting the next token, again and again.
- Fluent isn’t the same as true: it writes what sounds likely, not what it has checked.
- It knows less where it learned less: some languages, small places, and news after its cut-off date.

One word each

1. Warm-up (3 min): Type “Our town is” and tap the keyboard’s middle suggestion ten times. Is it fluent? Is it true?
2. Recall (5 min): Write the steps a chatbot repeats to build an answer.
3. Word game (8 min): In pairs or threes, build a story one likely word each.
4. Spot the drift (5 min): Mark where the story went wrong or stopped making sense.
5. Wrap-up (4 min): Write one way the game is like a chatbot, and one way it isn’t.

For a group of friends, or at home with your family. You need paper and a pen; a phone is only needed for the warm-up.

Let’s discuss

1. Where have you seen a phone or app predict your next word?
2. Why can a smooth, confident answer still be wrong?
3. What might a chatbot know less about in your country or language?

Exit ticket

- In one sentence: how does a chatbot write, and why does that mean you should check it?
