Malware: how it gets in

Cyber security · Level 3 · Lesson 1

In this lesson you will

- Name five kinds of malware and what each does.
- Explain the ways malware gets onto phones and computers.
- Choose the defence for each door, and know what to do if a device is infected.

Doors and defences

- Modded apps, cracked games: only the official store
- Holes in old software: automatic updates
- Shared USB sticks and attachments: built-in protection on
- Ransomware: keep a backup

Phone check-up

1. Warm-up (3 min): List every way an app has reached your phone.
2. Doors (5 min): Mark each way as official or risky.
3. Check-up (8 min): Run the five-line check on a phone.
4. Share (4 min): Tell a friend one thing you fixed.

Never remove apps from a shared family phone without asking. Never open files on a computer you suspect is infected.

Think about it

1. Why do attackers make malware look like a gift?
2. Why change passwords from a different device?
3. Why is a backup the real cure for ransomware?

Before you go

- One way malware gets in + the defence that closes it.
