Lesson notes · for you

Blanks, repeats and impossible values

Data engineering · Level 2 · Lesson 3

Time	Materials
15 min	Your phone with Darsi, for the Python steps; A table you made, or a made-up one, and a pen

Learning goals

- Tell a blank from a zero; never guess.
- Find repeats and impossible values.
- Write a Python check for blanks and values out of range.

Activity: Spot the problems

1. Look (3 min): Look at a made-up rain table with a 999, a blank, a minus sign and a repeat hidden in it.
2. Hunt (5 min): In pairs, circle every problem you can find.
3. Decide (4 min): Next to each problem, write what to do: say it's missing, keep one copy, or ask.
4. Compare (3 min): Work out the average with and without the problems. How much did it change?

Keep the numbers small so the averages are quick to work out by hand.

Discussion

- Why is a blank not the same as a zero?
- When is a repeat not really a repeat?
- Why check for blanks before checking the range?

Check yourself

- Write one blank, one repeat and one impossible value, and what you'd do with each.

Try it this week

Check a table you made, or one from class. Circle every blank, every repeat and every impossible value. For each one, write what you'd do.

Worksheet

Blanks, repeats and impossible values

Data engineering · Level 2 · Lesson 3

Name _____ Class _____ Date _____

1 **A mark says 25, but the test was out of 20. What do you do?**

◯ Keep it: the pupil did very well ◯ Check it with the teacher: it's impossible ◯ Change it to 20

2 **Zero rain and a blank rain reading mean the same thing.**

◯ True ◯ False

3 **None means a blank mark. Fix the program so it counts the blanks, not the zeros: it should print 2.**

```
marks = [14, None, 17, 0, None, 12]
blanks = 0
for m in marks:
    if m == 0:
        blanks = blanks + 1
print(blanks)
```

Write your program:

4 **This should flag 25 and -2, but it prints nothing. Which line is wrong?**

Circle the line with the mistake. Write it correctly:

```
1  marks = [14, 25, 9, -2, 18]
2  for m in marks:
3      if m < 0 and m > 20:
4          print(m, "check")
```

5 **Now both checks together. Run it: it crashes on a blank. Fix it so it skips the blanks and counts them, prints each impossible mark with “check”, then prints how many blanks there were.**

```
marks = [14, None, 25, 9, -2, None, 18]
blanks = 0
for m in marks:
    if m < 0 or m > 20:
        print(m, "check")
print(blanks, "blank")
```

Write your program:

✎ **Have you ever seen a number that couldn’t be right, in a game score, a report or a chart? What gave it away?**
