Connected things, safely

IoT · Level 1 · Lesson 4

Today you will

- Explain what makes a thing part of the Internet of Things: a sensor, a small computer and a connection.
- Give examples at home, at school and in town.
- Protect yourself: permissions, default passwords, and what you share.

Connected, and safe

- Sensor, small computer, connection
- Change factory passwords
- Turn on updates
- Allow only what's needed

Connected-things check

1. With an adult, list your connected things
2. For each: what it senses, how it connects
3. Ask: was its factory password changed?
4. Open one app's permissions in Settings
5. Switch off one it doesn't need

Only your own family's devices, and only with an adult. Never write real passwords on your sheet, and never try to get into someone else's device or account.

Let’s discuss

1. Which connected thing at school would be most useful, and what could go wrong?
2. Why do attackers want cheap devices like cameras and routers?
3. What should a device never collect about children?

Check yourself

- Name the three parts of an IoT device, and one way to keep it safe.
