Lesson plan · for the teacher

Audit an AI tool

AI · Level 4 · Lesson 1

Time
40 min

Materials
One phone with voice typing or a translation app, offline if possible, so pupils' voices stay on the phone (it saves data too); Board and chalk, with a tally table: speaker, language, words wrong; A short sentence to read aloud, with local names and words

Learning goals

- Test a voice or translation tool with our own voices and languages.
- Count its mistakes for each speaker and language.
- Explain why a tool can work better for some people than for others.

Activity: Test the tester

1. Warm-up (5 min): Ask who has used voice typing or a translation app, and whether it understood them. Collect two or three stories, good and bad.
2. Plan (7 min): Agree one short sentence with local names and words, and write it on the board. Agree the groups to compare — for example home languages, and girls and boys — and draw a tally table: speaker, language, words wrong. Switch the tool to offline if you can, so pupils' voices stay on the phone; if it works only online, tell pupils first that their voices go to the company.
3. Test (15 min): Volunteers take turns reading the sentence into one phone, in their own voice and home language (or reading it in English with their own accent). After each try, the class counts the words the tool got wrong and adds them to the table.
4. Compare (8 min): Groups add up the errors for each language or group of speakers. Ask: who does the tool work best for? Whose voices do you think it learned from?
5. Wrap-up (5 min): Explain that schools do the same before trusting a tool: one score can hide a group, so test with the people who will use it and count errors for each group. Then give the exit ticket.

Try the phone first. Offline voice typing or an offline translation app in your languages saves data and keeps pupils' voices on the phone. Speakers are volunteers: nobody has to speak. Record numbers only; keep no recordings.

Discussion

- Who did the tool understand best? Why might that be?
- Whose voices do you think it learned from?
- Should our school use a tool that works better for some pupils than for others? What would you ask first?

Exit ticket

- One group the tool found hard, and one question you would ask the company that made it.

Try it at school tomorrow

Play "Test the tester": Write one short sentence on the board. Pupils take turns reading it into voice typing (or a translation app) on one phone, in their own voices and home languages. The class keeps a tally of the words it gets wrong for each speaker and language. Then ask: who does this tool work best for, and why might that be? Use the tool offline if you can, so pupils' voices stay on the phone. If it works only online, their voices go to the company: tell pupils first, keep their own names out of the sentence, and let anyone who would rather not read keep the tally.

Practice questions · for you

Audit an AI tool

AI · Level 4 · Lesson 1

1 **Your audit shows the reading app wrongly marks village pupils' reading six times as often as town pupils', and the supplier won't say whose voices trained it. What should the school do?**

- ◯ Refuse it for now, and say what evidence would change your mind
- ◯ Adopt it — the overall score is high and pupils like it
- ◯ Pilot it in one class, with a teacher checking every mark

2 **Which belong in a small audit of a reading app? Choose all that apply.**

- ☐ Use the supplier's overall score as the result
- ☐ Test only your strongest readers, to be fair to the tool
- ☐ A teacher marks the same samples as the tool
- ☐ Collect about twenty real samples from each group
- ☐ Choose groups to compare, such as town and village

3 **If a tool is 95% accurate overall, it must be at least 90% accurate for every group of pupils.**

◯ True ◯ False

4 **Match each question for a supplier to the risk it checks.**

Whose data trained it, in which languages?	• • • •	Pupils' privacy
Where do pupils' recordings go?	• • • •	It may fail pupils unlike its training data
Does it work offline, on cheap phones?	• • • •	The school comes to depend on a tool it can't afford
What will it cost after the free year?	• • • •	Pupils without data or new phones are left out

✎ **Which AI tool is used, or offered, in your school? Which groups of pupils would you compare in an audit, and which errors would you count?**

Check your answers

Audit an AI tool

AI · Level 4 · Lesson 1

1. **Refuse it for now, and say what evidence would change your mind**

   The evidence isn't mixed: one group clearly fails and the supplier won't answer a key question.

2. **Choose groups to compare, such as town and village; Collect about twenty real samples from each group; A teacher marks the same samples as the tool**

   An audit compares groups on real work, with a teacher's marking as the answer key.

3. **False**

   An average can hide a group. If most of the people tested were city children, the tool can be wrong far more often for a smaller group, such as village children, and still average 95%.

4. **Whose data trained it, in which languages? — It may fail pupils unlike its training data**
   Where do pupils' recordings go? — Pupils' privacy
   Does it work offline, on cheap phones? — Pupils without data or new phones are left out
   What will it cost after the free year? — The school comes to depend on a tool it can't afford

   Each question tests a different risk: fairness, privacy, access and cost.
