Review notes · for you

What is AI? Unit check

AI · Level 1 · Unit check

Materials
Paper and a pen. No device needed.

Learning goals

- AI all around you
- How machines learn
- How AI sees
- When AI gets it wrong

Activity: Team quiz

1. Make teams of three or four
2. Read each question aloud; each team agrees on one answer
3. Reveal the answer and ask one team to explain why
4. Write down the question your team found hardest, and look it up in the lesson

Discussion

- Where will you look for AI tomorrow, and what will it be predicting?
- Which question surprised you, and why?
- What will you tell your family about this course?

Check yourself

- One idea from this course I'll remember, and where I'll use it

Try it this week
Explain one idea from this course to someone at home (AI predicts, machines learn from examples, pictures are numbers, or false alarms and misses), then ask them where they meet AI.

Quiz sheet

What is AI? Unit check

AI · Level 1 · Unit check

Name _____ Class _____ Date _____

1 **Which of these learns from examples?**

- ◯ A microwave that stops after two minutes
- ◯ A bus ticket machine that prints the fare for each stop
- ◯ A school bell that rings at 7:30
- ◯ A football app that predicts the winner from past results

2 **A chatbot that writes "I'm sorry to hear that" feels sorry for you.**

◯ True ◯ False

3 **Your cousin wants an app that tells ripe mangoes from unripe ones at her market stall. Put her steps in order.**

- ☐ Let the computer find the patterns
- ☐ Take 300 photos of mangoes at the stall
- ☐ Mark each photo "ripe" or "not ripe"
- ☐ Use it on new mangoes at the stall
- ☐ Try it on 50 new photos it never saw

4 **Why keep some labelled examples aside and never train on them?**

- ◯ Because a model can only learn a few examples
- ◯ To test whether the model learned the patterns
- ◯ To make training faster
- ◯ To save space on the phone

5 **Match each word to its meaning.**

Pixel	• • • •	The right answer attached to an example
Label	• • • •	A tiny square of a picture, stored as a number
Prediction	• • • •	The line a score must pass to raise the alarm
Threshold	• • • •	A best guess that can be wrong

6 **Which of these can fool vision AI? Choose all that can.**

- ☐ Using the app many times in a row, so it gets tired
- ☐ Something it never saw in training
- ☐ An unusual angle
- ☐ Very dim light
- ☐ Using a colour photo instead of black and white

7 **Complete the sentence.**

A photo is a _____ of numbers. Vision AI learns _____ in those numbers from many _____ photos.

Word bank: patterns · labelled · empty · grid · feelings

8 **If a spam filter is set to catch every possible scam, it will also hide more real messages.**

◯ True ◯ False

9 **Voice typing works well for your teacher but makes many mistakes with your grandfather's accent. What is the most likely reason?**

◯ The phone is too old ◯ Voice typing only works for teachers

◯ Your grandfather speaks wrongly ◯ It learned from few voices like his

10 **You're about to share a school notice with your class group, but the translation app has turned it into nonsense. Which are good steps? Choose all that are.**

☐ Delete every translation app for good ☐ Ask a teacher or someone who speaks both languages

☐ Share it anyway, because apps are usually right ☐ Report the bad translation in the app

☐ Check it against the original notice

Check your answers

What is AI? Unit check

AI · Level 1 · Unit check

1. **A football app that predicts the winner from past results**

   The football app found patterns in many past matches and uses them to make a best guess.

2. **False**

   It predicts the words that usually come next in a kind reply.

3. **Top to bottom: 3, 1, 2, 5, 4**

   These are the same five steps as the scam filter: collect examples, label them, train, test on new examples, then use.

4. **To test whether the model learned the patterns**

   Examples the model never saw show whether it learned patterns that work on new cases, or only memorised its training examples.

5. **Pixel — A tiny square of a picture, stored as a number**
   Label — The right answer attached to an example
   Prediction — A best guess that can be wrong
   Threshold — The line a score must pass to raise the alarm

   One word from each lesson: pictures are pixels, examples carry labels, AI gives predictions, and a threshold decides when it raises the alarm.

6. **Very dim light; An unusual angle; Something it never saw in training**

   Light changes every number, an angle changes the shapes, and a new thing gets the nearest label it knows.

7. **A photo is a grid of numbers. Vision AI learns patterns in those numbers from many labelled photos.**

   A photo is a grid of numbers, and vision AI learns patterns in them from many labelled photos.

8. **True**

   Some real messages look a little scam-like.

9. **It learned from few voices like his**

   This is a data gap: voices like your grandfather's were rare in its examples, so it makes more mistakes with them.

10. **Check it against the original notice; Ask a teacher or someone who speaks both languages; Report the bad translation in the app**

    Check, ask a person, report: that stops a wrong message spreading and helps fix the tool.
