Review notes · for you

AI and society: unit check

AI · Level 4 · Unit check

Materials
Paper and a pen. No device needed.

Learning goals

- Who decides what's fair?
- AI and the work of tomorrow
- Design an AI solution
- Test and pitch it

Activity: Team quiz

1. Make teams of three or four: friends, your AI club or family
2. Read each question aloud; each team agrees on one answer
3. Reveal the answer, and one team explains why
4. Write down the hardest question to revise tomorrow

Discussion

- Which of the five questions will you ask first about the next AI you meet?
- Which question surprised you, and why?
- What problem near you would you design an AI for, if it's needed at all?

Check yourself

- One idea from this unit I will use, and where

Try it this week
Choose one habit from this unit and use it this week: ask the five questions about an AI you meet, or show your one-page plan to someone who has the problem.

Quiz sheet

AI and society: unit check

AI · Level 4 · Unit check

Name _____ Class _____ Date _____

1 **A shop puts up a clear sign explaining that its cameras recognise returning customers. But customers can't say no, unless they stop shopping there. Which of the five questions does this fail?**

- ◯ Does it work as well for everyone?
- ◯ Is it open: do people know what it does?
- ◯ Did the people it affects agree?

2 **Even a deepfake that everyone can tell is fake can hurt the person it shows.**

- ◯ True
- ◯ False

3 **Match each person to their part in AI work.**

Data labeller	• • • •	Tries a model on new examples to find its mistakes
Tester	• • • •	Checks AI-typed notes before they are used
Engineer	• • • •	Tags photos so a model can learn
Nurse	• • • •	Builds the model and improves it

4 **Which of these is augmentation, not automation?**

- ◯ An app flags a possible crop disease, and the farmer decides what to do
- ◯ A spam filter deletes messages on its own
- ◯ A machine sorts parcels with nobody involved

5 **Your club wants to design an AI helper. Which questions belong in its design plan? Choose all that do.**

- ☐ Which is the newest AI tool we could use?
- ☐ Is AI needed at all?
- ☐ How much personal data can we collect, just in case?
- ☐ Whose problem is it?
- ☐ What data, with whose permission?
- ☐ What happens when it's wrong?

6 **Put the bus-stop planner's steps in order.**

- ☐ Every stop moves to the middle of its houses
- ☐ A person chooses how many stops
- ☐ The stops start at random houses
- ☐ Repeat until the stops stop moving
- ☐ Every house joins its nearest stop

7 **If a notice board solves the problem, you should still build an AI, because AI is more modern.**

- ◯ True
- ◯ False

8 **Which explanation of a decision would a user understand best?**

◯ “The algorithm decided; it’s too complex to explain.”

◯ “The information gain at the root node was highest for sky.”

◯ “It was sunny and humid, so it said stay inside.”

9 **Complete the sentence.**

The _____ inside an AI are choices people make. AI usually changes _____ more than whole jobs. A safe design keeps a _____ in charge.

Word bank: tasks · values · robots · person · secrets

10 **Which of these belong in a two-minute pitch people can trust? Choose all that do.**

☐ As many technical words as possible ☐ A promise that it never makes mistakes

☐ Where the data comes from, and whose permission you have ☐ The problem and who has it

☐ The risks, and how you’ll handle them

Check your answers

AI and society: unit check

AI · Level 4 · Unit check

1. **Did the people it affects agree?**

   The sign tells people what the cameras do, and nothing here tells us about their accuracy.

2. **True**

   Even an obvious fake can bully or embarrass the person it shows, and it can spread to people who don't know it's fake.

3. **Data labeller — Tags photos so a model can learn**
   Tester — Tries a model on new examples to find its mistakes
   Engineer — Builds the model and improves it
   Nurse — Checks AI-typed notes before they are used

   AI depends on many people: labellers give examples their answers, engineers build models, testers find mistakes on new examples, and people like nurses check AI's work in real life.

4. **An app flags a possible crop disease, and the farmer decides what to do**

   In augmentation, AI helps a person who still decides: the app spots a possible problem, and the farmer chooses what to do.

5. **Whose problem is it?; Is AI needed at all?; What data, with whose permission?; What happens when it's wrong?**

   A design plan asks whose problem it is, whether AI is needed, what data with whose permission, what the AI does, and what happens when it's wrong.

6. **Top to bottom: 4, 1, 2, 5, 3**

   A person chooses the number of stops first: that is a human decision.

7. **False**

   A notice board is free, works without internet or electricity, and puts nobody's information at risk.

8. **"It was sunny and humid, so it said stay inside."**

   A plain path through the questions tells the user what the AI looked at and why it decided.

9. **The values inside an AI are choices people make. AI usually changes tasks more than whole jobs. A safe design keeps a person in charge.**

   These are the unit's three big ideas: an AI's values are people's choices, so they can be questioned; AI changes tasks inside jobs more than it removes jobs; and a person stays in charge to check it and fix its mistakes.

10. **The problem and who has it; Where the data comes from, and whose permission you have; The risks, and how you'll handle them**

    A trusted pitch is honest and clear: the problem, the data and permission, and the risks with your plan for them.
