Loss, descent and backprop

University, 2

The step

- Loss is large when wrong
- Step against the slope
- Backprop: each weight’s share of the blame

The rate

- Too small crawls
- Too big climbs out

Steps by hand

1. Predict (5 min): Which rate climbs out?
2. By hand (10 min): Five steps on θ^2.
3. Backward (10 min): Blame one weight.
4. Lab (10 min): Good, then Too big.
5. Exit (5 min): The next θ.

Ask

1. Where does the gradient point?

Exit ticket

- θ^2 at 3, rate 0.1: write the next θ.
