Adversaries and noise

University, vision 4

In this lecture

- Compare an autoencoder, a GAN and diffusion in one table.
- Name each method’s typical failure.
- Explain why a sample is not evidence.

One step

- Pull toward black or white
- Not the picture back

The table first

1. Warm-up (5 min): Is this picture real?
2. Table (15 min): Method, loss, failure
3. Lab (10 min): Middle, then high noise
4. Cases (10 min): Three picture stories
5. Exit (5 min): Which method removes noise?

Ask

1. Which failure is whose?

Exit ticket

- Name the method that undoes noise.
