Lesson plan · for the teacher

A policy that holds

AI security · Level 4 · Lesson 3

Time
50 min

Materials
The school's current AI or ICT policy, if there is one; The risk map from lesson 1; A one-page outline on paper: tools, data, agents, detectors and fakes, reporting, review

Learning goals

- Write the security parts of a school AI policy on one page.
- Ask the right questions before approving a tool.
- Turn rules people must remember into checks systems enforce.

Activity: One-page policy workshop

1. Warm-up (5 min): Ask: which school rule about technology is most often forgotten? Note two answers: they show why enforced checks matter.
2. Draft (20 min): Split into groups, one per part: approved tools, data rules, agents and actions, detectors and fakes, reporting. Each writes three or four plain sentences, using the risk map from lesson 1.
3. Enforce (10 min): Put the parts together on one page. Mark each rule “remember” or “enforced”, and choose one “remember” rule to turn into a setting, a permission or an approval step.
4. Check (10 min): Two people read the page aloud, one as a parent and one as a pupil. Cross out any word they wouldn't understand, and check the page against your data protection law.
5. Close (5 min): Agree who owns the policy and the date of the next review, and when it will be shared with parents.

Bring the risk map from lesson 1 and any policy the school already has. Invite two pupils: they know which tools are really used.

Discussion

- Which of our rules depend only on people remembering?
- What should happen when a teacher reports a mistake?
- How will parents and pupils learn what the policy says?

Exit ticket

- Write one rule you will turn into an enforced check, and how.

Try it at school tomorrow
Draft your school's one-page AI security policy with two colleagues and two pupils. Mark each rule “remember” or “enforced”, and turn one rule into a setting, a permission or an approval step this week.

Practice questions · for you

A policy that holds

AI security · Level 4 · Lesson 3

1 **The timetable agent only needs to read the timetable, but it was given email too. What should the policy say?**

- ◯ Keep email: it might be useful one day
- ◯ Each agent gets only the tools its job needs
- ◯ Keep email, but log every message it sends

2 **Which questions belong in approving a new AI tool for school? Choose all that apply.**

- ☐ What can it do on its own?
- ☐ What minimum age do its terms set?
- ☐ Where does our data go, and is it used for training?
- ☐ Is it the most popular tool online?
- ☐ Who in the school will look after it?

3 **The policy says: an agent may use only the tools listed for it, and a tool that acts (send) also needs a person's yes. Write may_run(agent, tool, yes) so it returns True only when both rules are met.**

```
TOOLS = {
    "homework": ["timetable", "library"],
    "office": ["timetable", "send"],
}
ACTS = ["send"]

def may_run(agent, tool, yes):
    # Only listed tools; a yes before acting
    return True
```

Write your program:

4 **This check should let a message go only when the user asked for it AND said yes. Which line is wrong?**

Circle the line with the mistake. Write it correctly:

```
1  def may_send(asked, yes):
2      if asked or yes:
3          return True
4      return False
```

5 **Match each rule to a check that enforces it.**

No messages to parents without a teacher's yes	• • • •	Training switched off in the school account
The timetable agent only reads the timetable	• • • •	The bot can't send until a teacher taps Approve
Pupils' chats aren't used for training	• • • •	Automatic sign-out after 10 minutes idle
Staff sign out of shared computers	• • • •	Its tool list holds only the timetable

✎ **Pick one rule your school relies on people remembering. How could you turn it into a check the system enforces?**

Check your answers

A policy that holds

AI security · Level 4 · Lesson 3

1 **Each agent gets only the tools its job needs**

Least privilege: each agent gets only the tools its job needs.

2 **Where does our data go, and is it used for training?; What minimum age do its terms set?; What can it do on its own?; Who in the school will look after it?**

Data, age, powers and an owner decide whether a tool is safe for your pupils.

3

```
TOOLS = {
    "homework": ["timetable", "library"],
    "office": ["timetable", "send"],
}
ACTS = ["send"]

def may_run(agent, tool, yes):
    if tool not in TOOLS.get(agent, []):
        return False
    if tool in ACTS and not yes:
        return False
    return True
```

An allow-list refuses anything not written down, including agents nobody listed, and the approval check means nothing that acts runs without a person's yes, whatever the model decided.

4 **Line 2: `if asked and yes:`**

With or, a message nobody approved (asked but no yes), or a yes to a message nobody asked for, would be sent.

5 **No messages to parents without a teacher's yes — The bot can't send until a teacher taps Approve**
The timetable agent only reads the timetable — Its tool list holds only the timetable
Pupils' chats aren't used for training — Training switched off in the school account
Staff sign out of shared computers — Automatic sign-out after 10 minutes idle

Each rule can be built into the system: an approval button, a tool list, an account setting, an automatic sign-out.
