Filters that miss

AI security · Upper secondary · Lesson 1

In this lesson you will

- Explain how attacks aim at a whole AI app.
- Show why a word filter misses rewording and blocks innocent text.
- Write a check on the action in code.

Remember

- A jailbreak talks the model round; an injection hides orders in what it reads.
- Word filters miss rewording and block innocent text.
- Check the action in code: did you ask? did you say yes?

Activity: Filter versus check

1. Warm-up (3 min): Name an app that sends messages for you.
2. Filter (7 min): Write five banned words; friends reword a request.
3. Check (5 min): Run the same messages through “asked? approved?”.
4. Share (5 min): Compare what each guard stopped.

Use made-up messages only: no real names, numbers or passwords. No device? Do it all on paper.

Let’s discuss

1. Why can't a longer word list fix the filter?
2. Where else do apps use word filters, and what do they miss?
3. Which actions should always need your yes?

Check yourself

- Write one request a word filter would miss, and the question a check in code would ask about it.
