Automate the weekly report

Data engineering · Level 4 · Lesson 1

Today we will

- Describe a pipeline: extract, transform, load.
- Make every run safe to repeat.
- Tell passing faults from bad data.

Remember

- Extract, transform, load, on a schedule.
- Replace the day’s rows: idempotent.
- Retry passing faults; bad data needs a person.

The human pipeline

1. Warm-up (5 min): How is our report made?
2. Teach (8 min): Extract, transform, load.
3. Run (12 min): The human pipeline.
4. Fail (10 min): Stop it halfway, and rerun.
5. Wrap-up (5 min): What goes in the log?

Use made-up registers. Make the class sizes add up to a number pupils can check, such as 90, so a double count is easy to spot.

Let’s discuss

1. Why did adding the rows again give 152 pupils?
2. Which failures will a retry never fix?
3. What should the run log tell the head?

Exit ticket

- Write one passing fault and one bad-data fault, and what the pipeline should do with each.
