Questions in SQL

Data engineering · Level 3 · Lesson 2

In this lesson you will

- Query with SELECT, WHERE, ORDER BY and LIMIT.
- Summarise with COUNT, AVG and GROUP BY; explain NULL.
- Do the same count in Python with a dictionary.

Key ideas

- WHERE picks rows; ORDER BY sorts; LIMIT keeps a few.
- GROUP BY: one row per group.
- Judge every answer.

Human GROUP BY

1. Cards (3 min): one loan each
2. WHERE (3 min): only 5B
3. GROUP BY (5 min): one group per class
4. Check (4 min): do they add up?

Prepare the loan cards with made-up data before the lesson.

Let's discuss

1. Why do dates written year-month-day sort correctly?
2. When do COUNT(*) and COUNT(mark) give different answers?
3. How is a Python dictionary like GROUP BY?

Exit ticket

- Write a query for the number of loans of each book, the most first.
