How things talk

IoT · Level 4 · Lesson 1

Today you will

- Compare Bluetooth, Wi-Fi, mobile networks and LoRa by range, power and data.
- Follow a sensor reading from the device to an app, and say who handles it on the way.
- Choose a network for a device from what it needs.

Range, power and data

- Every radio trades range, power and data
- Short: Bluetooth and Wi-Fi
- Far: mobile networks and LoRa
- Many hands on the way: encrypt it

Radio hunt

1. List eight connected things at home or school.
2. Guess how each one talks.
3. Check settings, labels or manuals.
4. Note what data each one sends.
5. Circle the one you'd protect first.

Only look at devices: don't open them, unplug them or change their settings without permission. Leave passwords and addresses out of your table and your photos.

Let’s discuss

1. Which device surprised you, and why?
2. Why would a farm choose LoRa rather than Wi-Fi?
3. Who handles your data on the way, and which of them do you trust?

Check yourself

- Choose a network for a rain gauge 3 km away, and say why.
